# WTO Publishes 2026 World Tariff Profiles for More Than 150 Economies

The annual reference updates tariff and non-tariff data used by traders to compare bound commitments with actual border measures.

Tuesday, June 30, 2026

The World Trade Organization said it published the 2026 edition of “World Tariff Profiles” on Sunday, releasing updated tariff and non-tariff data for more than 150 economies in a reference work widely used by exporters, importers and trade analysts.

The annual publication was prepared jointly by the WTO, the International Trade Centre and UN Trade and Development. According to the WTO, it brings together tables showing each WTO member’s average “bound” tariffs, the maximum tariff levels committed under WTO rules, alongside the tariffs that members actually apply at the border.

The report presents those figures for all products and also separates them into agricultural and non-agricultural goods. It also includes one-page profiles for each economy with more detailed tariff information by product group. Those country profiles show not only the duties an economy imposes, but also the tariffs its exports face in major foreign markets.

The publication also devotes a separate section to non-tariff measures. The WTO said that section includes statistics on anti-dumping actions, countervailing measures and safeguards used by each economy. Non-tariff measures are also organized by product group, giving companies a broader picture of market access conditions beyond customs duties alone.

The data is also available through the WTO Stats portal, which allows users to consult the figures digitally. The WTO said French and Spanish editions of the report will be available for download in July.

For food and beverage exporters, including wine, beer and spirits producers, the new edition could serve as a practical tool for pricing and route planning across a large number of markets. Tariff gaps between bound rates and applied rates can affect cost estimates, while product-level information on non-tariff measures may help companies identify markets where regulatory barriers could complicate shipments even when headline tariffs appear manageable.

That matters in particular for alcoholic beverages, which often face different treatment across markets depending on product category, agricultural classification and domestic trade remedies. A winery or distiller comparing export destinations may use the profiles to assess not only current import duties but also whether a target market has a record of anti-dumping or safeguard actions affecting related product groups.

The release comes at a time when businesses are paying closer attention to trade costs and compliance risks. For beverage companies that sell across borders, especially smaller producers without large trade compliance teams, a consolidated source covering more than 150 economies can help narrow early-stage decisions about where to ship, how to price products and which markets may require more legal or customs review before entry.

The WTO described “World Tariff Profiles” as a comprehensive annual source on tariffs and non-tariff measures. By placing bound commitments next to applied rates and adding economy-by-economy profiles, the publication gives governments, traders and sector groups a clearer basis for comparing formal obligations with actual border conditions in global trade.
